

SURFACE FORCE

PROJECTION MEETING

May 18-21, 2026

List of suggested challenge areas discussion points for the Panel to deliberate:

1. Defining the Digital Core: DLA's Warehouse Modernization - Check

Directed to: Mr. Addaryl Roberts (DLA) Could you describe the specific warehouse modernization efforts C5MI is leading for DLA, particularly regarding the **WMS and DDSP modernization**? How does this transition from legacy siloed systems to a "digital core" fundamentally change how DLA manages global inventory using AI and Google Cloud Analytics, UiPath Automation processes in building global and resilient supply chains across congested and contested environments world-wide ?

2. Projecting Power in Contested and Congested Logistics environments

Directed to: Mr. Addaryl Roberts (DLA) Or Mr. Josh Hunt (USTRANSCOM) In a Congested or **Contested Logistics** environment where supply routes are systematically targeted, how does the real-time visibility ensure that critical materials still reach the warfighter at the "point of need"?

3. Navigating Congested Operations and AI

Directed to: Mr. Addaryl Roberts (DLA) & Mr. Summers (LMI) Logistics nodes are often **congested** with massive data and physical volume. How is DLA's AI posture leveraging **Google Cloud AI**—being used to automate workflows and reduce transactional friction (e.g., reducing material ordering from 8 clicks to 2)? Mr. Summers - How LMI is helping in bridging the gap between information and need for Action and What role AI is already playing to build faster decision making and more resilient supply chains ?

4. The "Trust Bridge" and Data Sovereignty

Directed to: Mr. Josh Hunt (USTRANSCOM) & Mr. Addaryl Roberts (DLA) A core objective of SFPM 2026 is strengthening the **"trust bridge"** between government and industry. How does the use of secure cloud environments ensure **Data Sovereignty** and analytics compliance while allowing private partners like C5MI and others to help in providing real-time operational support?

5. Autonomous Readiness: Moving from Visibility to Autonomy

Directed to: Alex Peiffer (Intramotev), As an example - C5MI maps clients on a roadmap from **"Visibility to Autonomy"**. How can autonomous hardware, like **TugVolt railcars**, be integrated into a modernized warehouse "digital thread" to bypass traditional surface transportation bottlenecks?

6. Predictive Performance in High-Stakes Environments

Directed to: Mr. Summers (LMI) Modernization isn't just about the current state; it's about the future. How does a unified **Common Operational Picture (COP)** allow for **predictive performance**—identifying a supply chain failure *before* it impacts a mission in a contested environment?

7. Resilience through "Just-in-Case" Models

Directed to: Mr. Addaryl Roberts (DLA) Or Mr. Josh Hunt (USTRANSCOM) Current trends show a shift from "Just-in-Time" to "**Just-in-Case**" resilience. How does the **SCAR (Supply Chain Agility & Resilience) framework** help DLA & **USTRANSCOM** maintain operational continuity even when an adversary disrupts cyber or physical lines or even Clouds ?

8. Operational Continuity in Disconnected Scenarios

Directed to: All Panelists How is DLA's architecture designed to remain operational in "**disconnected**" scenarios? If the link to the cloud is temporarily severed in a contested zone, how do modernized local warehouse systems maintain the flow of supplies?

9. Workforce Evolution for the AI Frontier

Directed to: All Panelists As we AI augment up to 70% of enterprise job functions, how must we evolve our workforce? What "human-led" skills are most critical for managing a modernized, AI-augmented warehouse during a high-end conflict?
